Re: ZUMRO STORAGE GUIDELINES

1. ZUMRO Shelter must be stored dry
2. All pre-plumbed hoses inside the tent must be dry prior to storage. This is especially important in conditions below freezing (32°F).
3. ZUMRO Shelter fabrics can withstand temperatures between -40°F and +120°F.
4. ZUMRO strongly recommends that customers inflate new tents upon receipt of equipment; suggested within 30 day – 90 days of receipt of new items. This is important for initial inspection and inflation.
5. ZUMRO strongly recommends customers inflate their tents at least 1 – 2 times per year for inspection and evaluation.
6. ZUMRO Shelters must be stored in a pest-free / rodent-free environment.
7. ZUMRO Shelters with roll-up manddoors and/or standard center zipper doors must leave zippers fully opened prior to storage to avoid any damage during deployment.
8. ZUMRO Shelters should be stored with the floor in place and attached to the shelter. For ease of deployment and protection of the airbeams and canopy during deployment, the floors must be attached to the shelter.
